

Federal Public Key Infrastructure (PKI) X.509 Certificate and CRL Extensions Profile

Document History

| Status | Release | Date | Comment | Audience |
|----------|---------|------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------|
| Approved | | 10/12/2005 | | FPKI |
| Draft | | 10/31/2012 | Incorporates changes for FBCA Change Proposal 2011-6 – Remove Requirements for LDAP URIs . Updated references, RFC 5289 in place of 3280, added RFC 4055, 5758, 2560, 3279, RFC 2616 replaced 1738, RFC 4516 in place of 2255, RFC 5751 replaced 3851, RFC 4514 replaced 2253, | Community FPKI Community |
| Approved | | 5/5/2015 | Incorporate changes for FBCA Change Proposal 2015-1 – make anyEKU optional when EKU is asserted in digital signature certificates. | FPKI Community |
| Approved | 1.8 | 7/17/2017 | Align with current practice and FBCA CP v2.31 No longer allow IP in URIs used in certificates Specify only minimum key size for Root CA Deleted comment about discouraging the use of policy Qualifiers Include Policy Constraints – non-critical – exception from RFC 5280 Include InhibitAnyPolicy – non-critical – exception from RFC 5280 | FPKI Community |
| Approved | 1.9 | 5/10/2018 | 2018-03 Mandate specific EKU in Common Policy subscriber certificates to align with Industry Practices | FPKI Community |

1. Introduction

This document specifies the X.509 version 3 certificate and version 2 certificate revocation list (CRL) profiles for Federal public key infrastructure (FPKI) systems. The profiles serve to identify unique parameter settings for Federal public key infrastructure systems.

In the interest of establishing commonality and interoperability among PKI communities outside the Federal government, it was decided that this profile should be based on a "standard PKI profile" but still contain the unique parameter settings for Federal systems. The most widely accepted PKI profile is RFC 5280 developed by the PKIX working group. The PKIX profile, Internet X.509 Public Key Infrastructure Certificate and Certificate Revocation List (CRL) Profile, identifies the format and semantics of certificates and CRLs for the Internet PKI. Procedures are described for processing and validating certification paths in the Internet environment. Encoding rules are provided for all fields and extensions profiled in both the X.509 v3 certificate and v2 CRL. Encoding rules for cryptographic algorithms specified in this profile are specified in RFC 3279, RFC 4055, and RFC 5758.

This FPKI profile complements the current PKIX profile. If a specific program needs to implement a subset of the FPKI certificate and/or CRL profile, the program should tailor their X.509 certificate and/or CRL profile using the parameters stipulated in this document together with the parameters stipulated in PKIX. Parameters stipulated in this document should take precedence. Any program deciding to tailor their FPKI-compliant X.509 certificates and/or CRLs to meet their specific needs must document the intended subset profile (referencing the FPKI profile as a basis) so that the certificate generation element will know how to populate the program-specific certificates.

The current version of this profile includes requirements that did not appear in previous versions. Operators of existing CAs are not encouraged to re-issue any certificates for the sole purpose of complying with this version of the profile. However, operators should make preparations to begin issuing all new certificates in conformance with the profile.

1.1. Structure

This document is divided into six sections. Section 1 includes this introduction. Sections 2 and 3 describe the v3 certificate and v2 CRL respectively. These sections specifically describe the differences in generation and processing requirements between the PKIX profile and FPKI profile. Unless otherwise noted in this profile, the reader should follow the PKIX generation and processing requirements for a particular field. Section 4 specifies rules for choosing character encoding sets for attribute values of type DirectoryString in distinguished names. Section 5 profiles the use of uniform resource identifiers (URIs) in certificates. Section 6 provides guidance on the selection of algorithms for signing certificates and CRLs and for the selection of public key types. Section 7 provides an overview of each of the certificate and CRL profiles included in the worksheets at the end of this document.

1.2. Acronyms

CA Certification Authority

CMS Cryptographic Message Syntax
CRL Certificate Revocation List
DER Distinguished Encoding Rules

DH Diffie-Hellman
DN Distinguished Name

DSA Digital Signature Algorithm
ECC Elliptic Curve Cryptography
ECDH Elliptic Curve Diffie-Hellman

ECDSA Elliptic Curve Digital Signature Algorithm
FBCA Federal Bridge Certification Authority
FPKI Federal Public Key Infrastructure
HTTP Hypertext Transfer Protocol

IP Internet Protocol

IETF

KEA Key Exchange Algorithm

LDAP Lightweight Directory Access Protocol

NIST National Institute of Standards and Technology

Internet Engineering Task Force

PKI Public Key Infrastructure

PKIX Public Key Infrastructure (X.509)

PVM Path Validation Module
RDN Relative Distinguished Name
RFC Request For Comments
RSA Rivest-Shamir-Adelman
URI Uniform Resource Identifier

v2 version 2 v3 version 3

2. X.509 v3 Certificates

X.509 v3 certificates contain the identity and attribute data of a subject using the base certificate with applicable extensions. The base certificate contains such information as the version number of the certificate, the certificate's identifying serial number, the signature algorithm used to sign the certificate, the issuer's distinguished name, the validity period of the certificate, the distinguished name of the subject, and information about the subject's public key. To this base certificate are appended numerous certificate extensions. More detailed information about X.509 certificates can be found in Recommendation X.509 and RFC 5280.

CAs create certificates for user authentication procedures that require one user to obtain another user's public key. So that users trust the public key, the CA employs a digital signature to cryptographically sign the certificate in order to provide assurance that the information within the certificate is correct. The fields in a certificate identify the issuer (i.e., CA), subject (i.e., user), version number, subject's public key, validity period, and serial number of the certificate along with the public key algorithm used to certify the certificate. A CA may also add certificate extensions containing additional information about the user or the CA, depending on the implementation.

All certification paths start from a trust anchor. A trust anchor is a CA that a user trusts to issue certificates based on out-of-band knowledge. The public key of a trust anchor is distributed to certificate users in the form of a "trust anchor certificate." A trust anchor certificate:

- is self-signed, that is, signed with the private key corresponding to the public key contained in the subject public key field of the certificate; ¹1
- contains any needed parameters in the subject public key info field, where the digital signature algorithm used in the certificate requires the use of parameters;

May 10, 2018

¹ NOTE: While in most cases, the public key of a CA that is to act as a trust anchor is distributed using self-signed certificates, this is not strictly necessary. Relying parties may obtain the public key of a trust anchor by other means.

- contains few or no extensions;
- is kept in protected memory or otherwise protected from alteration by an intruder;
- is transferred to the application or certificate using system in an authenticated manner. The signature on the trust anchor certificate cannot authenticate the certificate.

There is no single trust anchor for the entire Federal Government, although A-130 states all public key infrastructure (PKI) certificates used by an agency and issued in accordance with Federal PKI policy validate to the Federal PKI trust anchor operated by the FPKI Management Authority when being used for user signing, encrypting purposes, authentication and authorization. The trust anchor used by a certificate using application may be the CA that issued it a certificate or may be a CA that is at the top of a hierarchy of CAs. Which trust anchors may be used by agency certificate using systems to start certification paths is a matter of agency security policy.

The CAs in the FPKI may be cross-certified with each other. In order to facilitate secure intra-agency communication, CAs within the FPKI may either cross-certify with each other directly or may cross-certify with the FPKI either with the Federal Bridge Certification Authority (FBCA) or Federal Common Policy Certification Authority (FCPCA). In general, cross-certification with the FPKI is the preferable option since it maximizes inter-agency connectivity while minimizing the number of cross-certifications that any given CA needs to maintain.

Any certificate using system in the FPKI can view any CA in the FPKI as the trust anchor for starting certification paths, provided:

- 1. the certificate using system has an authenticated copy of the trust anchor's self-signed certificate; and,
- 2. local agency security policy allows the use of that CA as a trust anchor.

Agencies will designate the CAs that may be used as trust anchors by certificate using systems within the agency, and will establish the approved mechanisms for obtaining the trust anchors' public keys in a secure, authenticated manner. The FPKIMA will make the self-signed certificate of the Common Policy Root CA available for use as a trust anchor, and it is expected that this CA will be used as the trust anchor for most users who are issued certificates under the Common Policy.

X.509 v3 certificates provide a mechanism for CAs to append additional information about the subject's public key, issuer's public key, and issuer's CRLs. Standard certificate extensions are defined for X.509 v3 certificates. These extensions provide methods for increasing the amount of information the X.509 certificate conveys to facilitate automated certificate processing.

3. X.509 v2 Certificate Revocation Lists

CAs use CRLs to publicize the revocation of a subject's certificate. The CRLs are stored in the directory as attributes and are checked by relying parties to verify that a user's certificate has not been revoked. The fields in a CRL identify the issuer, the date the current CRL was generated, the date by which the next CRL will be generated, and the revoked users' certificates.

If a CA issues a large number of certificates, then the use of distribution points is encouraged in order to ensure that CRLs do not become too large. However, distribution points should not be specified as nameRelativeToIssuer since the NIST Recommendation for X.509 Path Validation [1] does not require Bridge-enabled PVMs to be able to process this feature. For the same reason, the use of indirect CRLs and CRLs segmented by reason code is discouraged. CAs that issue segmented CRLs are strongly encouraged to also issue full CRLs in order to accommodate third parties that use CRLs to generate OCSP responses.

Since Bridge-enabled PVMs PP are not required to be able to process delta-CRLs, CAs should not assume that relying parties can process them. However, CAs may still choose to issue delta-CRLs in addition to complete for scope CRLs in order to improve efficiency for those relying parties that can process the delta-CRLs.

CAs may optionally supplement the CRL based revocation mechanisms with on-line revocation mechanisms.

When an OCSP server is available that provides status information about a certificate, then the authorityInfoAccess extension for that certificate shall include a pointer to the OCSP server.

4. Encoding Distinguished Names

X.509 certificates and CRLs include distinguished names (DNs) to identify issuers of certificates and CRLs, subjects of certificates, and CRL distribution points. A DN consists of a sequence of relative distinguished names (RDNs) where each RDN consists of a set of attribute type and value pairs. In most cases, an RDN will only include a single attribute type and value pair, but in some cases the use of a multi-valued RDN (i.e., an RDN that includes more than one attribute type and value pair) may be appropriate. In general, multi-valued RDNs should not be included in DN that identify CAs or CRL distribution points. When multi-valued RDNs are included in DNs that identify end entities, they should only be included in the final RDN in the DN (i.e., the RDN that appears first when the DN is written as specified in RFC 4514) and no multi-valued RDN should include two instances of an attribute type.

Many of the attributes in distinguished names use the DirectoryString syntax. DirectoryString permits encoding of names in a choice of character sets: PrintableString, TeletexString, BMPString, UniversalString, and UTF8String. PrintableString is currently the most widely used encoding for attribute values in distinguished names. PrintableString is a subset of ASCII; it does not include characters required for most international languages. UTF8String is an encoding that supports all recognized written languages, including some ancient languages (e.g., Runic).

Name comparison is an important step in X.509 path validation, particularly for name chaining and name constraints computation. Many legacy implementations are unable to perform name comparisons when names are encoded using different character sets. To simplify correct operation of path validation, CAs are strongly encouraged to honor the subject's chosen character set when issuing CA certificates or populating extensions. That is, if a subject CA encodes its own name in the issuer field of certificates and CRLs it generates using TeletexString, the cross-certificate should use the same character set to specify that CA's name.

Name constraints are specified in CA certificates. The names specified in name constraints must be compared with the subject names in subsequent certificates in a certification path. To help ensure that name constraints are applied correctly, CAs should encode each attribute value in a name constraint using the same encoding as is used to encode the corresponding attribute value in subject names in subsequent certificates. In general, this may be accomplished by encoding attribute values in the name constraints extension of a certificate in the same way as they are encoded in the subject name of the certificate.

Subject names in end entity certificates do not figure in name chaining, but are used to validate name constraints. In order to ensure that name constraints can be computed correctly, attribute values that are shared between an end entity and its certificate issuer should be encoded identically. Attribute values in end entity names that are unique to the end entity (e.g., the common name) may be encoded in PrintableString or UTF8String without concern for name comparison issues.

Attributes of type DirectoryString in the distinguished names of new CAs should be encoded using the PrintableString encoding wherever possible. When the attribute value cannot be encoding using PrinableString, the UTF8String encoding should be used. However, if the new CA is being added to an existing PKI, attribute values in the new CA's DN that are shared with the DNs of pre-existing CAs may use the same encoding as was used in the DNs of the pre-existing CAs. As products that compare names encoded in different character sets become available, CAs should transition to either PrintableString or UTF8String encodings when they roll over to new key pairs.

For CAs within the Federal PKI, all attributes of type DirectoryString should be encoded using the PrintableString encoding. However, the common name attribute of end entity certificates may be encoded in UTF8String if the subject's name cannot be encoded using PrintableString.

5. Use of URIs in Distribution Points, authorityInfoAccess, and subjectInfoAccess Extensions

Uniform Resource Identifiers (URIs) are used in five different extensions within the certificate and CRL profiles in this document: cRLDistributionPoints, issuingDistributionPoint, FreshestCRL, authorityInfoAccess, and subjectInfoAccess. Two different protocols are used in this document: LDAP and HTTP. The specifications for URIs for these protocols may be found in RFC 4516 and RFC 2616, respectively.

Except for the id-ad-ocsp access method of the authorityInfoAccess extension, all URIs should have a prefix of "ldap" or "http" to indicate that the relevant information is

locatedin an LDAP accessible directory or via HTTP. For the id-ad-ocsp access method of the authorityInfoAccess, the URI should have a prefix of "http" to indicate that the transport protocol for the OCSP request/response messages is HTTP. The hostname of every URI should be specified as a fully qualified domain name. The port number of the server must be specified if it is not the default port number for the relevant protocol (80 for HTTP and 389 for LDAP).

In the cRLDistributionPoints and FreshestCRL extensions, the URI is a pointer to a current CRL that provides status information about the certificate. If LDAP is used, the URI must include the DN of the entry containing the CRL and specify the directory attribute in which the CRL is located (certificateRevocationList, authorityRevocationList, or deltaRevocationList). If the directory in which the CRL is stored expects the "binary" option to be specified, then the attribute type must be followed by ";binary" in the URI. If HTTP is used, the URI must point to a file that has an extension of ".crl" that contains the DER encoded CRL (see RFC 2585). When a URI is used as the DistributionPointName in the issuingDistributionPoint extension in a CRL, the value must match the URI in the corresponding distribution points in the cRLDistributionPoints extensions in certificates covered by the CRL.

Some examples of URIs that may appear in a cRLDistributionPoints, FreshestCRL, or issuingDistributionPoint extension are:

 $http://CRLs.example.com/fictitiousCRLdirectory/fictitiousCRL1.crl \\ Idap://smime2.nist.gov/cn=Good%20CA,o=Test%20Certificates,c=US?certificateRevocationList;binary \\ Idap://129.6.20.71/cn=onlyContainsCACerts%20CA,o=Test%20Certificates,c=US?authorityRevocationList;binary \\ Stripping (CRL) (CR$

The authorityInfoAccess extension uses URIs for two purposes. When the id-ad-caIssuers access method is used, the access location specifies where certificates issued to the issuer of the certificate may be found. If LDAP is used, the URI must include the DN of the entry containing the relevant certificates and specify the directory attribute(s) (e.g., cACertificate and crossCertificatePair) in which the certificates are located. If the directory in which the certificates are stored expects the "binary" option to be specified, then the attribute type must be followed by ";binary" in the URI. If HTTP is used, the URI must point to a file that has an extension of ".p7c" that contains a certs-only CMS message (see RFC 5751). The CMS message should include all certificates issued to the issuer of this certificate, but must at least contain all certificates issued to the issuer of this certificate in which the subject public key may be used to verify the signature on this certificate.

For a certificate issued by "Good CA", some examples of URIs that may appear as the access location in an authorityInfoAccess extension when the idad-caIssuers access method is used are:

 $http://Certs.example.com/fictitiousCertsOnlyCMS directory/certsIssuedToGoodCA.p7c \\ ldap://129.6.20.71/cn=Good%20CA,o=Test%20Certificates,c=US?cACertificate;binary,crossCertificatePair;binary$

When the id-ad-ocsp access method is used, the access location specifies the location of an OCSP server that provides status information about the certificate

(see RFC 2560).

The URI may include a path. Where privacy is a requirement, the URI may have a prefix of "https" to indicate that the transport protocol for OCSP requests/responses is HTTP over SSL/TLS. In this case, the default port number is 443, and the URI must include the server's port number if this default port number is not used.

The id-ad-caRepository access method for the subjectInfoAccess extension uses URIs to specify the location where CA certificates issued by the subject of the certificate may be found. If LDAP is used, the URI must include the DN of the entry containing the relevant certificates and specify the directory attribute(s) (e.g., cACertificate and crossCertificatePair) in which the certificates are located. If the directory in which the certificates are stored expects the "binary" option to be specified, then the attribute type must be followed by ";binary" in the URI. If HTTP is used, the URI must point to a file that has an extension of ".p7c" that contains a certs-only CMS message (see RFC 5751). The CMS message should include all CA certificates issued by the subject of this certificate, but must at least contain all CA certificates issued by the subject of this certificate in which the signature on the certificate may be verified using the subject public key in this certificate.

If the subject of the certificate only issues end entity certificates, then the subjectInfoAccess extension may be excluded. If the subject of the certificate issues self- issued certificates (e.g., key rollover certificates), but does not issue certificates to other CAs, then the LDAP URI in the subjectInfoAccess extension only needs to specify the cACertificate attribute.

For a certificate issued to "Good CA", some examples of URIs that may appear as the access location in an subjectInfoAccess extension when the id-ad-caRepository access method is used are:

 $http://Certs.example.com/fictitiousCertsOnlyCMS directory/CAcertsIssuedByGoodCA.p7c \\ ldap://129.6.20.71/cn=Good%20CA,o=Test%20Certificates,c=US?cACertificate;binary,crossCertificatePair;binary \\ ldap://129.6.20.71/cn=Good%20CA,o=Test%20Certificates,c=US?cACertificates,c=US?cACertificates,c=US?cACertificates,c=US?cACertificates,c=US?cACertificates,c=US?cACertificates,c=US?cACertificates,c=US?cACertificates,c=US.cACertificates,c=US.cACertificates,c=US.cACertificates,c=US.cACertificates,c=US.cACertificates,c=US.cACertificates,c=US.cACertificates,c=US.cACertificates,c=US.cACertificates,c=US.cACertificates,c=US.cACertificates,c=US.cACertificates,c=US.cACertificates,c=US.cACertificates,c=US.cACertificates,c=US.cACertificates,c=US.cACertificates,c=US.cACertificates,c=US.cACertificates,c=US.cACertificates,c=US.cACertificates,c=US.cACertificates,c=US.cACertificates,c=US.cACertificates,c=US.cACertificates,c=US.cACertificates,c=US.cACertificates,c=US.cACertificates,c=US.cACertificates,c=US.cACertificates,c=US.cACertificates,c=US.cACertificates,c=US.cACertificates,c=US.cACertificates,c=US.cACertificates,c=US.cACertificates,c=US.cACertificates,c=US.cACertificates,c=US.cACertificates,c=US.cACertificates,c=US.cACertificates,c=US.cACertificates,c=US.cACertificates,c=US.cACertificates,c=US.cACertificates,c=US.cACertificates,c=US.cACertificates,c=US.cACertificates,c=US.cACertifi$

6. Certificate and CRL Signing Algorithms and Subject Public Key Types

This profile permits the use of any FIPS approved algorithm for signing certificates and CRLs. However, agencies are cautioned against use of the weakest or strongest of these algorithms. Specifically, cryptographic algorithms with 80 bits of security strength (e.g., 1024 RSA, 1024 bit DSA, 160 bit ECDSA, and SHA-1) are nearing the end of their useful cryptographic lifetime. PKIs using these algorithms are strongly encouraged to migrate to stronger algorithms as soon as possible. Additionally, cryptographic algorithms with more than 256 bits of security strength (e.g., 4096+ bit RSA, 384+ bit ECDSA, SHA-384, and SHA-512) will greatly impact performance. Such algorithms are currently appropriate for highly sensitive data (e.g., classified data) rather than for general use.

7. Worksheet Contents

This document contains six worksheets. Each worksheet lists mandatory contents of a particular class of certificates or CRLs. Optional features that will be widely supported in the Federal PKI are also identified. These features may be included at the issuer's option. Certificate and CRL issuers may include additional information in non-critical extensions for local use, but should not expect clients in the Federal PKI to process this additional information. Critical extensions that are not listed in these worksheets must not be included in certificates or CRLs used in the Federal PKI.

The six worksheets are:

- 1. The *Self-Signed CA Certificate* worksheet defines the mandatory and optional contents of self-signed certificates issued by CAs in the Federal PKI for use by PKI client systems when establishing trust anchors.
- 2. The *Key Rollover CA Certificate* worksheet defines the mandatory and optional contents of key rollover certificates (self-issued certificates that are not self-signed).
- 3. The *Cross-Certificate* worksheet defines the mandatory and optional contents of certificates issued by CAs in the Federal PKI where the subject is a CA and the public key will be used to verify the signature on certificates. This profile applies whether the subject CA is considered to be hierarchically subordinate to the issuer or is considered to be a peer of the issuer. One optional feature in this worksheet is the use of the public key to verify the signature on CRLs.
- 4. The *CRL* worksheet defines the mandatory and optional contents of CRLs issued by CRL issuers in the Federal PKI.
- 5. The *End Entity Signature Certificate* worksheet defines the mandatory and optional contents of certificates issued by CAs in the Federal PKI where the subject is an end entity and the public key will be used to verify the signatures.
- 6. The *Key Management Certificate* worksheet defines the mandatory and optional contents of certificates issued by CAs in the Federal PKI where the subject is an end entity and the public key will be used to perform key management operations (e.g., key transport using RSA or Diffie-Hellman key agreement).

Note that the Federal PKI does not absolutely prohibit the use of dual-use end entity certificates, where an RSA or elliptic curve key is used for both digital signatures and key management. However, dual-use certificates are generally discouraged. As such, a worksheet for dual-use certificates is not supplied with this profile. CAs in the Federal PKI that issue dual-use certificates may use the End Entity Signature Certificate profile and assert the additional key usage bits as appropriate (i.e., key encipherment for RSA keys or key agreement for elliptic curve keys). Dual-use certificates must not assert the nonRepudiation bit.

Worksheet 1: Self-Signed CA Certificate Profile

| Field | Criticality Flag | Value | Comments |
|---------------------------|------------------|--------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------|
| Certificate | | | |
| tbsCertificate | | | Fields to be signed. |
| version | | 2 | Integer value of "2" for version 3 certificate. |
| serialNumber | | INTEGER | Unique positive integer |
| signature | | | |
| AlgorithmIdentifier | | | Must match Algorithm Identifier in signatureAlgorithm field. The parameters field is only populated when the algorithm is RSA. |
| algorithm | | | Choice of following algorithms: |
| | | 1.2.840.113549.1.1.5 | sha-1WithRSAEncryption |
| | | 1.2.840.113549.1.1.10 | id-RSASSA-PSS (RSA with PSS padding; 800-78 requires use with SHA-256 hash algorithm) |
| | | 1.2.840.113549.1.1.11 | sha256WithRSAEncryption |
| | | 1.2.840.10045.4.3.1 | ecdsa-with-Sha224 |
| | | 1.2.840.10045.4.3.2 | ecdsa-with-Sha256 |
| | | 1.2.840.10045.4.3.3 | ecdsa-with-Sha384 |
| | | 1.2.840.10045.4.3.4 | ecdsa-with-Sha512 |
| parameters | | 2.16.840.1.101.3.4.2.1 or 2.16.840.1.101.3.4.2.3 | For id-RSASSA-PSS only, specify either the SHA-256 or SHA-512 hash algorithm as a parameter |
| | | NULL | For all RSA algorithms except id-RSASSA-PSS |
| issuer | | | |
| Name | | | Will match the subject DN. |
| RDNSequence | | | |
| RelativeDistinguishedName | | | |
| AttributeTypeAndValue | | | |
| AttributeType | | OID | |
| AttributeValue | | see comment | See section 4. |
| validity | | | |
| notBefore | | | |
| Time | | | |
| utcTime | | YYMMDDHHMMSSZ | Use for dates up to and including 2049. |
| generalTime | | YYYYMMDDHHMMSSZ | Use for dates after 2049. |
| notAfter | | | |
| Time | | | |
| utcTime | | YYMMDDHHMMSSZ | Use for dates up to and including 2049. |
| generalTime | | YYYYMMDDHHMMSSZ | Use for dates after 2049. |
| subject | | | |
| Name | | | Will match the issuer DN. |
| RDNSequence | | | |
| RelativeDistinguishedName | | | |
| AttributeTypeAndValue | | | |
| AttributeType | | OID | |
| AttributeValue | | see comment | See section 4. |

| Field | Criticality Flag | Value | Comments |
|---------------------------|------------------|--------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| subjectPublicKeyInfo | | | |
| algorithm | | | |
| AlgorithmIdentifier | | | Public key algorithm associated with the public key. May be either RSA or elliptic curve. |
| algorithm | | 1.2.840.113549.1.1.1 | RSA |
| | | 1.2.840.10045.2.1 | Elliptic Curve |
| parameters | | See comment | For RSA include NULL. For ECC include parameters. |
| subjectPublicKey | | BIT STRING | For RSA, modulus must be at least 2048 bits. For ECC, public key must be at least 224 bits. |
| required extensions | | | |
| subjectKeyldentifier | FALSE | | This extension is required to assist in path development. |
| keyldentifier | | OCTET STRING | Typically derived using the SHA-1 hash of the public key. |
| subjectInfoAccess | FALSE | | subjectInfoAccess consists of a sequence of accessMethod and accessLocation pairs. Only one access method is defined for use in CA certificates. |
| AccessDescription | | | |
| accessMethod | | id-ad-caRepository (1.3.6.1.5.5.7.48.5) | Self-signed certificates must include at least one instance of this access method that includes the URI name form to specify the location of an HTTP accessible server. Certificates may also include a URI name form to specify an LDAP accessible directory server. Each URI must point to a location where CA certificates issued by the subject of this certificate may be found. |
| accessLocation | | | |
| GeneralName | | | |
| uniformResourceIdentifier | | Idap:// or http:// | See section 5. |
| basicConstraints | TRUE | | The contents of this extension are not used in the X.509 path validation algorithm. Path length constraints should not be included since they may not be enforced. |
| cA | | TRUE | |
| keyUsage | TRUE | | The contents of this extension are not used in the X.509 path validation algorithm. If the subject public key may be used for purposes other than certificate and CRL signing (e.g., signing OCSP responses), then the digitalSignature and/or nonRepudiation bits may be set as well. |
| digitalSignature | | 0 | |
| nonRepudiation | | 0 | |

| authorityInfoAccess | FALSE | | authorityInfoAccess consists of a sequence of accessMethod and accessLocation pairs. Two access methods are defined: one for locating certificates issued to the certificate issuer and one for locating an OCSP server that provides status information about this certificate. |
| AccessDescription | | | Access Method #1 |
| accessMethod | | id-ad-calssuers (1.3.6.1.5.5.7.48.2) | All certificates must include at least one instance of this access method that uses the URI name form to specify the location of an HTTP accessible server where certificates issued to the issuer of this certificate may be found. Certificates may also include an instance of this access method that uses the URI name form to specify the location of an LDAP accessible directory server. |
| accessLocation | | | |
| GeneralName | | | |
| uniformResourceIdentifier | | ldap:// or http:// | See section 5. |
| AccessDescription | | | Access Method #2 |
| accessMethod | | id-ad-ocsp (1.3.6.1.5.5.7.48.1) | For this access method, the access location should use the URI name form to specify the location of an OCSP server that provides status information about this certificate. |
| accessLocation | | | |
| GeneralName | | | |
| uniformResourceldentifier | | http:// | See section 5. |
| subjectInfoAccess | FALSE | | subjectInfoAccess consists of a sequence of accessMethod and accessLocation pairs. Only one access methods is defined for use in CA certificates. |
| AccessDescription | | | |
| accessMethod | | id-ad-caRepository (1.3.6.1.5.5.7.48.5) | All CA certificates must include at least one instance of this access method that uses the URI name form to specify the location of an HTTP accessible server where CA certificates issued by the subject of this certificate may be found. CA certificates may also include an instance of this access method that uses the URI name form to specify the location of an LDAP accessible directory server. |

| Field | Criticality Flag | Value | Comments |
|---------------------------|------------------|----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| RelativeDistinguishedName | | | |
| AttributeTypeAndValue | | | |
| AttributeType | | OID | |
| AttributeValue | | see comment | Encoding of name must use the encoding of the issuer field in certificates and CRLs issued by this subject CA. |
| subjectPublicKeyInfo | | | |
| algorithm | | | |
| AlgorithmIdentifier | | | Public key algorithm associated with the public key. May be RSA, DSA, or elliptic curve. |
| algorithm | | 1.2.840.113549.1.1.1 | RSA |
| | | 1.2.840.10040.4.1 | DSA |
| | | 1.2.840.10045.2.1 | Elliptic Curve |
| parameters | | See comment | For RSA include NULL; for DSA and ECC include parameters if subject and issuer have different parameters. If parameters are inherited, omit field for DSA and include NULL for ECC. |
| subjectPublicKey | | BIT STRING | |
| required extensions | | | |
| authorityKeyldentifier | FALSE | | |
| keyldentifier | | OCTET STRING | Typically derived using the SHA-1 hash of the signer's public key. |
| subjectKeyldentifier | FALSE | | |
| keyldentifier | | OCTET STRING | The value in this field must be the same as the value that the subject CA uses in the authority key identifier extension of the certificates and CRLs that it signs with the private key that corresponds to the subject public key included in this certificate. |
| keyUsage | TRUE | | If the subject public key may be used for purposes other than certificate and CRL signing (e.g., signing OCSP responses), then the digitalSignature and/or nonRepudiation bits may be set as well. |
| digitalSignature | | 0 | |
| nonRepudiation | | 0 | |
| keyEncipherment | | 0 | |
| dataEncipherment | | 0 | |
| keyAgreement | | 0 | |
| keyCertSign | | 1 | Always asserted in CA certificates. |
| cRLSign | | 1 | Asserted if this key is also used to sign CRLs. |
| encipherOnly | | 0 | |
| decipherOnly | | 0 | |
| certificatePolicies | FALSE | | |
| PolicyInformation | | | The inclusion of policy qualifiers is discouraged. |
| policyldentifier | | OID | |
| basicConstraints | TRUE | | This extension must appear in all CA certificates. |
| cA | | TRUE | |
| pathLenConstraint | | INTEGER | The use of a path length constraint is optional. |

| Field | Criticality Flag | Value | Comments |
|---------------------------|------------------|-----------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| cRLDistributionPoints | FALSE | | This extension must appear in all certificates and must include at least an HTTP URI distribution point name. This profile recommends against the use of indirect CRLs or CRLs segmented by reason code. |
| DistributionPoint | | | |
| distributionPoint | | | |
| DistributionPointName | | | |
| fullName | | | |

| AttributeType | | OID | |
| AttributeValue | | see comment | See section 4. |
| uniformResourceldentifier | | ldap:// or http:// | See section 5. |
| authorityInfoAccess | FALSE | | authorityInfoAccess consists of a sequence of accessMethod and accessLocation pairs. Two access methods are defined: one for locating certificates issued to the certificate issuer and one for locating an OCSP server that provides status information about this certificate. |
| AccessDescription | | | Access Method #1 |
| accessMethod | | id-ad-calssuers (1.3.6.1.5.5.7.48.2) | All certificates must include at least one instance of this access method that uses the URI name form to specify the location of an HTTP accessible server where certificates issued to the issuer of this certificate may be found. Certificates may also include an instance of this access method that uses the URI name form to specify the location of an LDAP accessible directory server. |
| accessLocation | | | |
| GeneralName | | | |
| uniformResourceIdentifier | | ldap:// or http:// | See section 5. |
| AccessDescription | | | Access Method #2 |
| accessMethod | | id-ad-ocsp (1.3.6.1.5.5.7.48.1) | For this access method, the access location should use the URI name form to specify the location of an OCSP server that provides status information about this certificate. |
| accessLocation | | | |
| GeneralName | | | |
| uniformResourceldentifier | | http:// | See section 5. |
| subjectInfoAccess | FALSE | | subjectInfoAccess consists of a sequence of accessMethod and accessLocation pairs. Only one access methods is defined for use in CA certificates. |
| AccessDescription | | | |

| Field | Criticality Flag | Value | Comments |
|---------------------------|------------------|--------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| accessMethod | | id-ad-caRepository (1.3.6.1.5.5.7.48.5) | All CA certificates must include at least one instance of this access method that uses the URI name form to specify the location of an HTTP accessible server where CA certificates issued by the subject of this certificate may be found. CA certificates may also include an instance of this access method that uses the URI name form to specify the location of an LDAP accessible directory server. |
| accessLocation | | | |
| GeneralName | | | |
| uniformResourceIdentifier | 541.05 | ldap:// or http:// | See section 5. |
| PolicyConstraints | FALSE | | When this extension appears, at least one of requireExplicitPolicy or inhibitPolicyMapping must be present. When present, this extension should be marked as noncritical, to support legacy applications that cannot process policyConstraints* |
| requireExplicitPolicy | | | |
| SkipCerts | | INTEGER | |
| inhibitPolicyMapping | | | Should be included if local policy prohibits policy mapping. |
| SkipCerts | | INTEGER | 1 in certs issued to a cross-certified PKI, 0 when issued to a subordinate, 2 within the infrastructure to a CA which may issue a cross-certificate to a Bridge |
| InhibitAnyPolicy | FALSE | | This extension should be marked as noncritical, to support legacy applications that cannot process InhibitAnyPolicy.* |
| SkipCerts | | INTEGER | 0 – specific policies are required in the FPKI |
| optional extensions | | | |
| issuerAltName | FALSE | | Any name types may be present; only the most common is specified here. |
| GeneralNames | | | |
| GeneralName | | | |
| rfc822Name | | IA5String | Electronic mail address of the PKI administration. |
| policyMappings | See comment | | This extension may appear in a CA certificate. This extension may be set to noncritical to support legacy applications that cannot process the policy mappings extension. |
| issuerDomainPolicy | | OID | OID of policy from issuing CA's domain that maps to the equivalent policy in the subject CA's domain. |
| subjectDomainPolicy | | OID | OID of policy in the subject CA's domain that may be accepted in lieu of the issuer domain policy (above). |

21

| Field | Criticality Flag | Value | Comments |
|-------------------------------------|------------------|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| nameConstraints | TRUE | | If present, any combination of permitted and excluded subtrees may appear. If permitted and excluded subtrees overlap, the excluded subtree takes precedence. It is recommended that name constraints only be imposed on the directoryName name form. |

^{*}Note: The recommended criticality setting is different from RFC 5280.

Worksheet 4: CRL Profile

| Field | Criticality Flag | Value | Comments |
|---------------------------|------------------|--------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CertificateList | | | |
| tbsCertList | | | Fields to be signed. |
| version | | 1 | Integer value of "1" for version 2 CRL. (CAs that are not capable of issuing version 2 CRLs may issue version 1 CRLs. Other than the omission of extensions all other fields should be populated as specified in this profile.) |
| signature | | | |
| AlgorithmIdentifier | | | Must match Algorithm Identifier in signatureAlgorithm field. The parameters field is only populated when the algorithm is RSA. |
| algorithm | | Cł | noice of following algorithms: |
| | | 1.2.840.113549.1.1.5 | sha-1WithRSAEncryption |
| | | 1.2.840.113549.1.1.10 | id-RSASSA-PSS (RSA with PSS padding; 800-78 requires use with SHA-256 hash algorithm) |
| | | 1.2.840.113549.1.1.11 | sha256WithRSAEncryption |
| | | 1.2.840.10040.4.3 | id-dsa-with-sha1 |
| | | 1.2.840.10045.4.1 | ecdsa-with-SHA1 |
| | | 1.2.840.10045.4.3.1 | ecdsa-with-Sha224 |
| | | 1.2.840.10045.4.3.2 | ecdsa-with-Sha256 |
| | | 1.2.840.10045.4.3.3 | ecdsa-with-Sha384 |
| | | 1.2.840.10045.4.3.4 | ecdsa-with-Sha512 |
| parameters | | 2.16.840.1.101.3.4.2.1 or 2.16.840.1.101.3.4.2.3 | For id-RSASSA-PSS only, specify either the SHA- 256 or SHA-512 hash algorithm as a parameter |
| | | NULL | For all RSA algorithms except id-RSASSA-PSS |
| issuer | | | |
| Name | | | Issuer name should be encoded exactly as it is encoded in the issuer fields of the certificates that are covered by this CRL (or the cRLIssuer field of the cRLDistributionPoints extensions in the case of indirect CRLs). |
| RDNSequence | | | |
| RelativeDistinguishedName | | | |
| AttributeTypeAndValue | | | |
| AttributeType | | OID | |
| AttributeValue | | See Comment. | See section 4. |
| thisUpdate | | | |
| Time | | | |
| utcTime | | YYMMDDHHMMSSZ | Use for dates up to and including 2049. |
| generalTime | | YYYYMMDDHHMMSSZ | Use for dates after 2049. |
| nextUpdate | | | RFC 5280 requires all CRLs to include a nextUpdate time. |
| Time | | | |
| utcTime | | YYMMDDHHMMSSZ | Use for dates up to and including 2049. |
| generalTime | | YYYYMMDDHHMMSSZ | Use for dates after 2049. |
| revokedCertificates | | | |

| Field | Criticality Flag | Value | Comments |
|---------------------------------------------|------------------|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| userCertificate | | INTEGER | Serial number of certificate being revoked |
| revocationDate | | | |
| Time | | | |
| utcTime | | YYMMDDHHMMSSZ | Use for dates up to and including 2049. |
| generalTime | | YYYYMMDDHHMMSSZ | Use for dates after 2049. |
| crlEntryExtensions | | | |
| Extensions | | | The inclusion of CRL entry extensions is optional. |
| reasonCode | FALSE | | This extension may be included if the issuer wishes to provide information about the reason that a certificate was revoked. |
| CRLReason | | | Any one of these CRL reasons may be asserted: keyCompromise, cAcompromise, affiliationChanged, superseded, or cessationOfOperation. If the revocation reason is unspecified, then the reasonCode extension should not be included. The removeFromCRL reason code may only be used in delta CRLs and the use of certificateHold is discouraged. |
| invalidtyDate | FALSE | | This extension may be included if the invalidity date precedes the revocation date. |
| GeneralizedTime | | YYYYMMDDHHMMSSZ | Use this format for all dates. |
| crlExtensions | | | |
| Extensions | | | |
| authorityKeyldentifier | FALSE | | Must be included in all CRLs. |
| keyldentifier | | OCTET STRING | Typically derived using the SHA-1 hash of the signer's public key. |
| cRLNumber | FALSE | INTEGER | Monotonically increasing sequential number. Must be included in all CRLs. |
| issuingDistributionPoint distributionPoint | TRUE | | This extension appears in segmented CRLs. If the CRL covers all unexpired certificates issued by the CRL issuer (i.e., all unexpired certificates in which the issuer field contains the same name as the issuer field of the CRL), then this extension does not need to be included. This profile recommends against the use of indirect CRLs or CRLs that do not cover all reason codes. |
| DistributionPointName | | | If the issuer generates segmented CRLs (i.e., CRLs that do not cover all unexpired certificates in which the issuer field contains the same name as the issuer field in the CRL), this field must be present and must specify the same names as are specified in the distributionPoint field of the cRLDistributionPoints extensions of certificates covered by this CRL. |

| AttributeValue | | See comment. | See section 4. |
| uniformResourceIdentifier | | IA5String | See section 5. |
| onlyContainsUserCerts | | BOOLEAN | If set to TRUE, this CRL only covers end entity certificates. (NOTE: If onlyContainsUserCerts is set to TRUE and the CRL covers all end entity certificates issued by the issuer of this CRL, then the distributionPoint field may be omitted.) |
| onlyContainsCACerts | | BOOLEAN | If set to TRUE, this CRL only covers CA certificates. If onlyContainsUserCerts is TRUE, this field must be FALSE. (NOTE: If onlyContainsCACerts is set to TRUE and the CRL covers all CA certificates issued by the issuer of this CRL, then the distributionPoint field may be omitted.) |
| IndirectCRL | | FALSE | This profile recommends against the use of indirect CRLs. However, if this CRL covers certificates that were not issued by the issuer of this CRL, then this field must be set to TRUE. |
| FreshestCRL | FALSE | | If this is a complete for scope CRL, and delta- CRLs are issued for the same scope, then either this CRL or the certificates that it covers should include the FreshestCRL extension. When the FreshestCRL extension is used in a CRL, only the distributionPoint field is used. The reasons and cRLIssuer fields must be omitted. |

| PolicyInformation | | | The inclusion of policy qualifiers is discouraged. |
| policyldentifier | | OID | |
| cRLDistributionPoints | FALSE | | This extension must appear in all certificates and must include at least an HTTP URI distribution point name. This profile recommends against the use of indirect CRLs or CRLs segmented by reason code. |
| DistributionPoint | | | |
| distributionPoint | | | |
| DistributionPointName | | | |
| fullName | | | |
| GeneralNames | | | |
| GeneralName | | | |

| AttributeType | | OID | |
| AttributeValue | | see comment | See section 4. |
| uniformResourceIdentifier | | Idap:// or http:// | See section 5. |
| authorityInfoAccess | FALSE | | authorityInfoAccess consists of a sequence of accessMethod and accessLocation pairs. Two access methods are defined: one for locating certificates issued to the certificate issuer and one for locating an OCSP server that provides status information about this certificate. |
| AccessDescription | | | Access Method #1 |
| accessMethod | | id-ad-calssuers (1.3.6.1.5.5.7.48.2) | All certificates must include at least one instance of this access method that uses the URI name form to specify the location of an HTTP accessible server where certificates issued to the issuer of this certificate may be found. Certificates may also include an instance of this access method that uses the URI name form to specify the location of an LDAP accessible directory server. |
| accessLocation | | | |
| GeneralName | | | |
| uniformResourceldentifier | | Idap:// or http:// | See section 5. |
| AccessDescription | | | Access Method #2 |
| accessMethod | | id-ad-ocsp (1.3.6.1.5.5.7.48.1) | For this access method, the access location should use the URI name form to specify the location of an OCSP server that provides status information about this certificate. |
| accessLocation | | | |
| GeneralName | | | |
| uniformResourceIdentifier | | http:// | See section 5. |
| extKeyUsage | BOOLEAN | | This extension MUST appear in certificates issued after June 30, 2019. The extension should be non-critical and shall not include the anyExtendedKeyUsage value. The values listed below for keyPurposeID are recommended for inclusion. Additional keyPurposeIDs, consistent with signing purposes, may be specified. Note: For certificates issued prior to June 30, 2019, anyExtendedKeyUsage may be present or the entire extension may be absent. |
| keyPurposeID | | 1.3.6.1.5.5.7.3.4 | id-kp-emailProtection |
| | | 1.3.6.1.4.1.311.10.3.12 1.2.840.113583.1.1.5 | MSFT Document Signing Adobe Certified Document Signing Note: this value has been deprecated by Adobe |
| optional extensions | | | |
| issuerAltName | FALSE | | Any name types may be present; only the most common is specified here. |

Worksheet 6: Key Management Certificate Profile

| Field | Criticality Flag | Value | Comments |
|---------------------------|------------------|------------------------------|--------------------------------------------------------------------------------------------------------------------------------------|
| Certificate | | | |
| tbsCertificate | | | Fields to be signed. |
| version | | 2 | Integer value of "2" for version 3 certificate. |
| serialNumber | | INTEGER | Unique positive integer. |
| signature | | | |
| AlgorithmIdentifier | | | Must match Algorithm Identifier in signatureAlgorithm field. The parameters field is only populated when the algorithm is RSA. |
| algorithm | | С | hoice of following algorithms: |
| | | 1.2.840.113549.1.1.5 | sha-1WithRSAEncryption |
| | | 1.2.840.113549.1.1.10 | id-RSASSA-PSS (RSA with PSS padding; 800-78 requires use with SHA-256 hash algorithm) |
| | | 1.2.840.113549.1.1.11 | sha256WithRSAEncryption |
| | | 1.2.840.10040.4.3 | id-dsa-with-sha1 |
| | | 1.2.840.10045.4.1 | ecdsa-with-SHA1 |
| | | 1.2.840.10045.4.3.1 | ecdsa-with-Sha224 |
| | | 1.2.840.10045.4.3.2 | ecdsa-with-Sha256 |
| | | 1.2.840.10045.4.3.3 | ecdsa-with-Sha384 |
| | | 1.2.840.10045.4.3.4 | ecdsa-with-Sha512 |
| parameters | | 2.16.840.1.101.3.4.2.1 | For id-RSASSA-PSS only, specify either the SHA- |
| | | or 2.16.840.1.101.3.4.2.3 | 256 or SHA-512 hash algorithm as a parameter |
| | | NULL | For all RSA algorithms except id-RSASSA-PSS |
| issuer | | | |
| Name | | | |
| RDNSequence | | | |
| RelativeDistinguishedName | | | |
| AttributeTypeAndValue | | | |
| AttributeType | | OID | |
| AttributeValue | | see comment | See section 4. |
| validity | | | |
| notBefore | | | |
| Time | | | |
| utcTime | | YYMMDDHHMMSSZ | Use for dates up to and including 2049. |
| generalTime | | YYYYMMDDHHMMSSZ | Use for dates after 2049. |
| notAfter | | | - |
| Time | | | |
| utcTime | | YYMMDDHHMMSSZ | Use for dates up to and including 2049. |
| generalTime | | YYYYMMDDHHMMSSZ | Use for dates after 2049. |
| subject | | | |
| Name | | | X.500 Distinguished name of the owner of the subject public key in the certificate. |
| RDNSequence | | | |

| Field | Criticality Flag | Value | Comments |
|---------------------------|------------------|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| RelativeDistinguishedName | | | |
| AttributeTypeAndValue | | | |
| AttributeType | | OID | |
| AttributeValue | | see comment | See section 4. |
| subjectPublicKeyInfo | | | |
| algorithm | | | |
| AlgorithmIdentifier | | | Public key algorithm associated with the public key. May be RSA, Diffie-Hellman, elliptic curve, or KEA. |
| algorithm | | 1.2.840.113549.1.1.1 | RSA |
| | | 1.2.840.10046.2.1 | Diffie-Hellman |
| | | 1.2.840.10045.2.1 | Elliptic Curve |
| | | 2.16.840.1.101.2.1.1.22 | Key Exchange Algorithm |
| parameters | | See comment | For RSA include NULL. For DH and KEA, parameters must always be included. For ECC include parameters if subject and issuer have different parameters; if parameters are inherited, use a value of NULL. |
| subjectPublicKey | | BIT STRING | |
| required extensions | | | |
| authorityKeyldentifier | FALSE | | |
| keyldentifier | | OCTET STRING | Typically derived using the SHA-1 hash of the signer's public key. |
| subjectKeyldentifier | FALSE | | |
| keyldentifier | | OCTET STRING | Typically derived using the SHA-1 hash of the subject public key. |
| keyUsage | TRUE | | As specified below according to algorithm. |
| digitalSignature | | 0 | |
| nonRepudiation | | 0 | |
| keyEncipherment | | 1 | Used when subject public key is RSA. |
| dataEncipherment | | 0 | |
| keyAgreement | | 1 | Used when subject public key is DH, ECC, or KEA. |
| keyCertSign | | 0 | |
| cRLSign | | 0 | |
| encipherOnly | | 0 | There is no requirement to support this key usage. |
| decipherOnly | | 0 | There is no requirement to support this key usage. |
| certificatePolicies | FALSE | | |
| PolicyInformation | | | The inclusion of policy qualifiers is discouraged. |
| policyIdentifier | | OID | |
| cRLDistributionPoints | FALSE | | This extension must appear in all certificates and must include at least an HTTP URI distribution point name. This profile recommends against the use of indirect CRLs or CRLs segmented by reason code. |
